

CompliVibe

Startup Thesis

Investor Data Room | Confidential | June 2026

3 Paying customers paid logos	5 Beta trials pilot demand	13 Waitlist pipeline pull	\$150K Round target \$1.5M post-money
---	--	---	---

Thesis in one sentence

AI is becoming a core operating layer inside every company, but trust, governance, evidence, compliance, and monitoring are fragmented. CompliVibe starts with a regulatory wedge and expands into the operating system for AI trust.

01 CORE THESIS

The next GRC platform is AI-native.

Vanta automated security compliance. OneTrust automated privacy and GRC. Sprinto and Scrut brought compliance automation to Indian SaaS. CompliVibe is building for the AI regulation era: a system of record where AI systems, controls, evidence, risks, reviews, regulatory packs, and buyer-ready trust outputs live together.

Big market shift AI is moving from experiments into products, workflows, vendors, copilots, and agents.	Narrow wedge Start with EU AI Act and India DPDP oriented readiness for AI-first companies.	Infrastructure outcome The long-term platform is governance memory, evidence, review trails, and trust reporting.
---	---	---

Investor view

This is a wedge-to-platform company. The first buyer pain is compliance readiness and procurement trust. The larger outcome is AI trust infrastructure across governance, observability, evidence, and operational control.

02 WHY NOW

AI trust is moving from “nice to have” to operating requirement.

Regulation EU AI Act full applicability begins 2 Aug 2026 with phased exceptions; India DPDP and Colorado ADMT add more trust obligations.	Procurement Enterprise buyers increasingly ask vendors to prove AI governance, risk, evidence, and review before approval.	AI sprawl AI systems, models, vendors, datasets, and agents are spreading faster than companies can govern manually.
--	--	--

Catalyst	What changes for buyers	CompliVibe wedge
AI regulation	Classification, documentation, evidence, risk workflows, and controls become earlier needs.	Framework mapping, AI system inventory, evidence vault, readiness reports.
Privacy + data governance	AI companies must show accountability around personal data, notices, consent, and breach readiness.	DPDP controls, documentation, review trails, evidence mapping.
Enterprise trust	Procurement asks for proof before contracts move.	Trust center, questionnaires, exportable evidence, human review.

03 PROBLEM THESIS

AI companies can lose deals because trust cannot be proven fast enough.

The pain appears before enterprise sales, regulated deployment, investor diligence, and large-customer procurement. The current process is scattered across spreadsheets, docs, screenshots, Slack threads, legal comments, and founder memory.

Current workflow - AI system inventory lives in spreadsheets or scattered docs. - Evidence is collected reactively after a buyer or auditor asks. - Legal, compliance, product, engineering, and sales teams work from different versions of truth. - Consultants help, but outputs often become static documents instead of living systems.	Buyer need - Inventory of AI systems, models, vendors, datasets, owners, and use cases. - Mapped controls, evidence, risk decisions, review trails, and change history. - Reports for procurement, investor diligence, and regulatory readiness. - A credible workflow combining automation with human/legal/compliance review.
--	---

Founder-market fit angle

CompliVibe is built for the moment when an AI-first startup is asked: “Show us how your AI is governed, documented, reviewed, monitored, and evidenced.”

04 PRODUCT THESIS

Start as a compliance wedge. Become the AI trust system of record.

Layer	What it contains	Why it matters
AI system inventory	Systems, models, vendors, datasets, use cases, owners, criticality.	Creates one source of truth for what AI exists.
Evidence vault	Policies, controls, integration evidence, approvals, review notes, audit logs.	Turns trust claims into proof.
Framework packs	EU AI Act + DPDP wedge; ISO 42001, NIST AI RMF, SOC/ISO, Colorado/U.S. ADMT as expansion.	Gives buyers a starting reason and expansion path.
Trust graph + scoring	Relationships between systems, risks, controls, evidence, vendors, reports, and readiness.	Creates an intelligence layer and switching costs.
Human review	Approve, reject, request changes, sign off, and publish with accountability.	Avoids the overclaim that AI replaces lawyers or compliance teams.

Today Compliance and governance wedge: inventory, evidence, mapped controls, readiness reports, review workflows.	Next Trust center, buyer questionnaires, richer integrations, automation rules, scoring, and change monitoring.	Long term Governance + observability + compliance + evidence + assurance in one operating layer.
---	---	--

05 MARKET AND GTM THESIS

The first customer is the AI-first company that needs trust before it can sell.

CompliVibe should not start by trying to sell every enterprise GRC use case. The early wedge is focused: AI-first startups and vendors preparing for enterprise, regulated, or EU/India-facing sales.

Customer segment	Why they care now	Best entry point
AI-first SaaS startups	Enterprise buyers ask about AI use, privacy, evidence, policies, and risk controls.	Readiness assessment + evidence vault.
ML platforms / AI vendors	They need model/system documentation and buyer-trust artifacts.	AI system inventory + regulatory pack.
Fintech / healthtech AI teams	Regulated sales cycles need stronger proof and review trails.	Governance workflow + human review.
EU / regulated expansion	Companies need early readiness before sales or procurement friction.	EU AI Act / DPDP starter pack.

Initial GTM - Founder-led outbound to AI-first SaaS and regulated startups. - Convert beta trials/waitlist into paid pilots with defined proof milestones. - Partner with incubators, accelerators, compliance advisors, and EU market-entry experts.	Expansion levers - Framework packs, evidence volume, integrations, trust center, and assurance review. - Move from one readiness pack to company-wide AI governance workspace. - Build switching costs through evidence history and review trails.
--	---

06 TRACTION THESIS

Early traction is real, but the data-room story must stay proof-backed.

3 Paying customers paid logos	5 Beta trials pilot demand	13 Waitlist pipeline pull	\$150K Round target \$1.5M post-money
---	--	---	---

Signal	Current read	Next proof to attach
Paid logos	3 paying customers: Vessor AI, Fitlit, GlideRun AI.	Invoices, payment receipts, customer confirmations.
Pipeline	5 beta trials, 2 in conversion, 13 waitlist.	CRM export, next steps, pilot agreements, usage screenshots.
Product depth	EU AI Act + DPDP wedge, 828 mappings, 23+ integration direction.	Product QA, demo access, mapping sample, integration logs.
90-day plan	Verify, convert, then scale MRR/references/repeatable pipeline.	Weekly metrics dashboard, conversion tracker.

Investor discipline

Do not claim PMF, guaranteed compliance, full automation, lawyer replacement, or verified MRR until proof exists. The stronger story is honest: early revenue, early demand, clear wedge, and disciplined proof plan.

07 FINANCING THESIS

The \$150K round should buy proof, not vanity.

The capital plan should turn early demand into verifiable revenue, product depth, customer references, clean security documentation, and repeatable sales learning.

Use of funds	Allocation	Execution purpose
Product & Engineering	\$67,500 / 45%	Backend engineer, frontend engineer, interns, v4.0 rebuild, product hardening.
Compliance & Research	\$37,500 / 25%	Compliance associates mapping controls, evidence workflows, and regulatory packs.
GTM & Sales	\$30,000 / 20%	Convert beta trials and waitlist into paying customers; build founder-led sales motion.
Cloud & Infrastructure	\$15,000 / 10%	Hosting, security tooling, production infrastructure, reliability readiness.

Round structure	Post-raise cash	Primary milestone
\$150K angel/pre-seed at \$1.5M post-money for 10% investor ownership.	\$169,250 starting cash: \$19,250 current cash + \$150K raise.	Ship v4.0, convert demand, launch Trust Center/evidence vault, strengthen audit/security readiness.

08 RISK AND CLOSING THESIS

Win by being ambitious in vision and conservative in claims.

Risk	Investor concern	Company response
Early traction	Are three paying customers enough?	Show invoices, usage, references, weekly conversion, and a 90-day proof plan.
Regulatory complexity	Can a startup keep up with changing law?	Use source-backed updates, expert review, versioning, and clear disclaimers.
Competition	Why not Vanta, OneTrust, Sprinto, Scrut, Credo AI?	CompliVibe starts AI-native: systems, evidence, controls, risk, reviews, and trust outputs.
Automation claims	Is evidence really automated?	Claim automation only where integrations pull evidence; label structured mappings clearly.
Legal liability	Can customers rely on outputs?	Position as infrastructure that speeds review, not legal advice or counsel replacement.

Final thesis

CompliVibe is investable if it proves that AI-first companies will pay for a faster, cheaper, and more credible way to become enterprise-ready. The near-term wedge is compliance readiness; the long-term company is AI trust infrastructure.

Source notes

Source area	How it supports the thesis
Uploaded docs	One-pager, traction PDF, team bios, use-of-funds PDF, cap table, financial model, advisor agreement.
External sources	EU AI Act timeline, India DPDP Rules source material, Colorado ADMT obligations, AI governance market estimate.
